

# Connecting Multiple Items to a Single Control Harness:

In order to run multiple items on one controller an in-line signal amplifier may need to be used. These amplifiers go in-line between the controller and the item it is controlling. Amplifiers help the signal reach the item it is controlling. For example if a few of your lights are flashing and not acting right you will most likely need a signal amplifier to make them work correctly. Not every light needs an amplifier as just 2 amplifiers will run 2 whips, Halo lights, Fang lights, 8 rock lights.

Contact multiple Y-splitters to run more items. A signal amplifier may be needed to run multiple lights off one run.

10 foot extension lead used for long installs. A signal amplifier may be required due to 12v voltage drop.
